

ABSTRACT OF THE DISCLOSURE

An apparatus and a method for displaying a digitised document to an audience. A memory (20) is provided for storing of at least one digitised document in a computer readable file format, wherein a processing unit (10) is adapted to retrieve documents and process it into a near-identical document replica. Moreover, a display (30) visualises document and animation of the document, such as the turning of a layer, being controlled by the audience. The function of the apparatus is characterised by the audience indicating when real-time animation of a layer (51, 52) is about to begin or revert to its initial state, and the indication is governed by crossing a dividing line with an indicating element substantially in lateral direction.
